## The Shrinkage of Photographic Paper.

## R. R. Ramsey.

In mounting some siectrograph prints 1 wats very much chagrined to fint that they were at diffrent lengths. as if they had heen taken on different spectographs. Thesc prints had been printert on teveloping paper. deyeloperl. Washed, hried amd then soaked and momeded wet. It hat happened that the paper used came in quite latise sheets and in cutting down to size it was ecomomital to ent some pieces lengthwise of the paper, while other pieces were cot cosswise. sererall prints were marle and the best were selectal for mominting. In this chance selection soms were lensthwise and others were erosswise of the paper. The expansion and contraction in the promess of develophine and washing was different in the different directions and it was necessary to make a new set of prints, care being taken to have the paper all cat the same way. The monnting Was done hefore drying to frevent exressive expansion.

I thonght it misht be of interest to experiment with several brands of paper to determine if this tanlt was fomnd in atl hrands of paper or in this particular brand alone.

An Sx10-inch phate was exposerl to smight and then developed, giv-
 dividing engine A space of 20 centimeters was ruled on the lons efge and a 15 centimeter space on the short edge of the plate. Thus by printing and developing I had a photograph of the seale, and measmrement Would sive the amonnt of shrinkase or expansion. Five different papers Were used. All were printed, developed, fixed, and washed in the usual m:tmer. Ifter washing. a sample of each brand was mounted on cardboard. The others were stack batck side to alass amd allowed to dry. When tried measurements were taken of the lensth and breadth. Then samples of each bramd were selected from the ummomited photographs, soaked in water and monnted on cardboard. Ifter drying, these were also measured.

The accompanying table will give the results:

| Paper. | Dried on Glass. |  | Mounted Wet on Cardboard. |  | Dried, Soaked and Mounted Wet on Cardboard. |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | length. | Breadth. | Length. | Breadth. | Length. | Breadth. |
| Darko-Matt | $-.55^{\prime \prime}$ | - $51 \%$ | $2.3{ }^{\circ}$ | $23^{\circ} \mathrm{C}$ | $2.6 C_{c}$ | .5\% |
| Velox C. | - $32 . i$ | -45\% | . $52 \%$ | $1.4 \%$ | . 80 | 1.80 |
| Velox S | $-2^{\text {r }}{ }_{\text {c }}$ | -.31\% | $1.6{ }^{\circ}$ | $3{ }^{\circ}$ | $1.9{ }^{\text {c }}$ | 7\% |
| Azo C | -.075 ; | - $18^{\circ} \mathrm{O}$ | $1.8{ }^{\circ} \mathrm{i}$ | $3^{\circ}$ | $2.1{ }^{\prime \prime}$ | . $66 \%$ |
| Azo E: | $-.06 \%$ | -. 23.0 | 28\% | 1.5\% | .520 | 1.8\% |

The results show that all brands act very much alike. When dried on ghas there is a trifte shrinkase. The momited photograblis show considerable expansion and in erery ease a latger amonnt in one direction than in the other. In some eases the per rente of expansion is tent times that in the other slirection.
