# Impingement of Fishes at the Indianapolis Power and Light Company Generating Station on the White River at Petersburg, Indiana 

John 0. Whitaker, Jr. Department of Life Sciences<br>Indiana State University<br>Terre Haute, Indiana 47809

## Introduction

Impingement is the lodging of organisms on the protective screens at the inflow channels of electric generating plants. The screens function to keep unwanted items out of the mechanism of the plant, and are automatically cleaned periodically by water running through them. The "impinged" items were previously allowed to move out a trough and back into the river, but now are removed. Impingement has caused concern as a possible hazard to fish at generating plants.

This work was part of a study of the effects of the Indianapolis Power and Light Company generating station on the White River at Petersburg, Indiana (Proffitt, 1969; Proffitt and Benda, 1971; Whitaker and Schlueter, 1973; Whitaker, Schlueter and Tieben, 1977). The objective of this phase of the work was to determine the extent of impingement of fish at the generating plant.

## Materials and Methods

To determine effects of impingement on fish of the White River at the IPALCO plant, seines were placed across the impingement outflow trough and all fish were collected during extended sampling periods. The first seine was a $1 / 4-\mathrm{in}$. nylon mesh, and the second was of $1 / 8-\mathrm{in}$. nylon mesh. Both were heavily weighted. The nets were in position for $25-35$ hours per collecting trip, and were checked periodically. Accumulated debris was removed and examined for the presence of fish, mollusks, and other large animal life. Early in the study, the fish were identified and numbers of the various species were simply counted, while later, they were assessed by size class. Also, during the latter part of the study, notation was made as to whether the fish were dead, alive, or in various stages of decomposition when collected. It was assumed that the "fresh" fish had been alive when impinged, but that the rotting fish had simply floated into the plant entrance after death. However, some of the fresh fish may have been dead when impinged, as dead fish can remain in fresh condition for several days in cold weather. On January $23-25,1976$, a sample was taken before, during and after deicing, to see if that process had any notable effect on the fishes impinged.

Eight reptiles were taken in the impingement sample, but are not included in the Tables. They included four map turtles, Graptemys geographica, three softshelled turtles, Trionyx spinifer, and one water snake, Nerodia sipedon.

## Results

The total number, number per hour, and projected number per year of all species of fish taken in the impingement sample (excluding the deicing sample) are given in Table 1. These totaled 10,772 individuals. Of these, $9784(90.8 \%)$ were gizzard shad, Dorosoma cepedianum, followed by Ictalurus punctatus, channel catfish (444, 4.1\%) and Ictiobus sp., buffalo (149, 1.4\%; young individuals of $I$. niger and I. bubalus). A total of 32 separate species is iisted, along with some individuals identified only to genus and some unidentified fish.

TABLE 1. Numbers of fish impinged during the 1399.75 hours ( 58.3 days) of sampling time at the IPALCO generating plant at Petersburg, together with number per hour and projected number per year.

| Species | Total No. | No/hr | Projected $\mathrm{No} /$ Year |
| :---: | :---: | :---: | :---: |
| Dorosoma cepedianum-Gizzard Shad | 9784 | 6.99 | 61231 |
| Ictalurus punctatus - Channel Catfish | 444 | 0.32 | 2779 |
| Ictiobus sp.-Buffalo | 149 | 0.11 | 932 |
| Aplodinotus grunniens-Freshwater drum | 72 | 0.05 | 451 |
| Pimephales vigilax-Bullhead minnow | 46 | 0.03 | 288 |
| Hybognathus nuchalis-Silvery minnow | 35 | 0.03 | 219 |
| Cyprinus carpio-Carp | 30 | 0.02 | 188 |
| Notropis spilopterus - Spotfin shiner | 29 | 0.02 | 181 |
| Ichthyomyzon unicuspis-Silver lamprey | 26 | 0.02 | 163 |
| Lepomis macrochirus - Bluegill | 20 | 0.01 | 125 |
| Pylodictus olivaris-Flathead catfish | 19 | 0.01 | 119 |
| Carpiodes carpio-River carpsucker | 16 | 0.01 | 100 |
| Hiodon alosoides-Goldeye | 14 | 0.01 | 88 |
| Lepomis cyanellus - Green sunfish | 13 | 0.01 | 81 |
| Micropterus punctulatus-Spotted bass | 8 | 0.01 | 50 |
| Pomoxis annularis-White crappie | 6 | 0.004 | 38 |
| Carpiodes velifer-Highfin carpsucker | 6 | 0.004 | 38 |
| Morone chrysops - White bass | 6 | 0.004 | 38 |
| Alosa chrysochloris - Skipjack herring | 5 | 0.004 | 31 |
| Lepomis megalotis-Longear sunfish | 4 | 0.003 | 25 |
| Stizostedion canadense-Sauger | 3 | 0.002 | 19 |
| Lepisosteus osseus - Longnose gar | 3 | 0.002 | 19 |
| Moxostoma sp.-Redhorse sp. | 3 | 0.002 | 19 |
| Hybopsis sioreriana-Silver chub | 3 | 0.002 | 19 |
| Anguilla rostrata-American eel | 1 | 0.001 | 6 |
| Polyodon spathula-Paddlefish | 1 | 0.001 | 6 |
| Lepisosteus platostomus - Shortnose gar | 1 | 0.001 | 6 |
| Lepomis sp.-Sunfish sp. | 1 | 0.001 | 6 |
| Carpiodes cyprinus-Quillback | 1 | 0.001 | 6 |
| Scaphirhynchus platorhynchus-Shovelnose sturgeon | 1 | 0.001 | 6 |
| Carassius auratus - Goldfish | 1 | 0.001 | 6 |
| Ictiobus cyprinellus - Bigmouth buffalo | 1 | 0.001 | 6 |
| Semotilus atromaculatus-Creek chub | 1 | 0.001 | 6 |
| Ictiobus bubalus - Smallmouth buffalo | 1 | 0.001 | 6 |
| Ictalurus melar-Black bullhead | 1 | 0.001 | 6 |
| Unidentified fish | 17 | 0.01 | 106 |
| Totals | 10,772 | 7.70 | 67,413 |

Seasonal distribution of the fish is given in Table 2. It is apparent that relatively few fish are generally impinged. Sampling periods usually varied from 25 to 35 hours, and the total number of fish taken was less than 100 individuals in all but 8 of the 23 sampling periods. The largest impingement collections occurred on September 13-14, September 20-21, September 27-28, and October 11-12, 1975 , when totals of $404,7432,875$, and 476 individuals were taken. Again, the great majority of these fish, totalling 8727 of the 9097 ( $95.9 \%$ ) fish, were gizzard shad, Dorosoma cepedianum. These fish were mostly in the $2-4^{\prime \prime}$ size classes, and thus included schools of young individuals

Tables 1 and 2 include all fish taken by impingement. However, some of the fish taken in these samples were in various stages of decomposition, and thus presumably were dead before drifting through the plant intake. Table 3 gives data for live and fresh fish in the later impingement samples. The total number of fish impinged during these periods was 10,533 in 928.5 hours, or 11.37 per hour.

Table 2. Seasonal distribution of fish taken by impingement sampling at IPALCO generating plant at Petersburg, Indiana. Species in which at least 50 individuals were taken are summarized separately; rest are combined.

|  | 9784 | 444 | 149 | 72 | 323 | 10,772 | 1399.75 | 7.70 |

Of these, 3767 were partially decomposed, leaving a total of 6,766 live or fresh fish, or 7.29 per hour. Again, the few samples with large numbers of small Dorosoma (Fall, 1975) contribute greatly to the overall calculated numbers per hour. In the 27 samples, there were 16 samples with less than 1 live or freshly killed fish per hour, and 21 with less than 3.

Most of the fish taken in the impingement samples were relatively small, less than 6 in . total length (many were $2-4^{\prime \prime}$ long). Table 4 summarizes data for all fish over 6 in. long taken in the impingement sample from August 23, 1975,

Table 3. Fish in varying stages of decomposition (1976), during 928.5 hours of sampling.

TABLE 4. Size classes of fish impinged at the IPALCO generating plant at Petersburg, Indiana. (Most of the 10,274 fish taken between August 23, 1975, and June 1976 were less than 6 inches long. Fish greater than 6 inches total length are indicated here.)

## Size groupings

| Species | $\mathbf{7 - 1 2 \prime}$ | $\mathbf{1 3 - 1 8 \prime \prime}$ | $18+{ }^{\prime \prime}$ | Totals |
| :--- | :---: | :---: | :---: | :---: |
| Dorosoma cepedianum | 51 | 0 | 0 | 51 |
| Ichthyomyzon unicuspis | 20 | 0 | 0 | 20 |
| Hiodon alosoides | 14 | 0 | 0 | 14 |
| Cyprinus carpio | 2 | 7 | 3 | 12 |
| Ictalurus punctatus | 6 | 0 | 0 | 6 |
| Carpiodes carpio | 4 | 0 | 0 | 4 |
| Aplodinotus grunniens | 3 | 1 | 0 | 4 |
| Alosa chrysochloris | 3 | 0 | 0 | 3 |
| Moxostoma sp. | 1 | 1 | 2 | 1 |
| Scaphyrhynchus platorhynchus | 0 | 0 | 0 | 1 |
| Morone chrysops | 0 | 1 | 0 | 1 |
| Pomoxis annularis | 1 | 0 | 0 | 1 |
| Ictiobus bubalus | 0 | 1 | 0 | 1 |
| Lepomis macrochirus | 1 | 0 | 0 | 1 |
| Ictalurus melas | 1 | 0 | 4 | 122 |

through June, 1976 (when length of impinged fish were recorded). Of the 10,274 fish taken during this period, only 122 or $1.2 \%$ of the individuals were longer than 6 in. Of these, nearly half were gizzard shad, and 20 were silver lampreys.

Another question of interest related to the effect of the deicing process (warming of the intake screens by spraying warm water into the intake just ahead of the screens) on the impingement of the fish. A combination of scheduling problems, equipment problems at the plant, and warm weather reduced the sampling when deicing was occurring to one period. This period was on January 23 to 25, 1976 (Table 5). On January 24, ambient river temperature was $4^{\circ} \mathrm{C}$ at the sur-

Table 5. Fish taken by impingement sampling before and during deicing, Jan. 23-25, 1976, at IPALCO plant at Petersburg, Indiana.

|  | 21 hours |  | 30 hours |  | 51 hours |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Before deicing |  | During deicing |  | Total |  |
|  | No. | No/hr | No. | No/hr | No. | No/hr |
| Ictiobus sp. | 21 | 1.0 | 46 | 1.53 | 67 | 1.31 |
| Aplodinotus grunniens | 12 | 0.57 | 10 | 0.33 | 22 | 0.43 |

| Notropis atherinoides | 2 | 0.10 | 0 | - | 2 | 0.04 |
| Hybognathus nuchalis | 1 | 0.05 | 0 | - | 1 | 0.02 |
| Ictalurus punctatus | 1 | 0.05 | 11 | 0.37 | 12 | 0.24 |
| Morone chrysops | 0 | - | 1 | 0.03 | 1 | 0.02 |
| Lepomis macrochirus | 0 | - | 1 | 0.03 | 1 | 0.02 |
| Lepisosteus osseus | 0 | - | 1 | 0.03 | 1 | 0.02 |
| Totals | 39 | 1.86 | 86 | 2.87 | 125 | 2.45 |

face. The impingement sampling seines were in place for 21 hours January 23-24 before deicing occurred. A total of 39 fish was taken, or 1.86 per hour. The deicers were then turned on and impingement sampling occurred for 30 additional hours and 86 fish were taken, or 2.87 per hour. This difference was not great, but was significant ( $\mathrm{X}^{2}=5.16,1 \mathrm{df}$ ).

It is unfortunate that more sampling periods were not possible in 1976 when deicers were operating. Additional data are needed, but it does appear that the deicer may attract some fish that otherwise would not have been impinged.
