Hammond and other Hourishing cities in the northwest part of the State would experience the most direct benefits by the increase of business and manufacturing facilities and consequent increase in population.

The proposition is worth at least a passing thought and is eommended to the State and general governments for further consideration.

Some Properties of the Simeliday Point.

> By Robert J. Aley.

Monsieur Emile Lemoine, at the Lyons meeting of the French Assotiation for the advancement of the Sciences in $18 i 3$. called attention to a particular print within the triangle, which he tallet the center of antiparallel medians. Since that time a number of mathematicians have studied the point and have discovered many of its properties. The point is such an interesting one that a brief collection of its more striking properties may be of some ralue. No claim is made to completeness

## DEFINITIONS OF THE POINT.

1. The point of concurrency of the bisectors of all lines antiparallel to the sides of the triangle.
2. The point of concurrency of the lines isogonal conjugate to the medians of the triangle; that is, the point of concurrency of the symmedians of the triangle.
3. The point within the triangle, the sum of the syuares of whose distances from the three sides is the least possible.
4. The point within the triangle, whose distances from the sides is directly proportional to the sides.

## NAMES OF THE POINT.

1. Center of antiparallel medians, proposed by Monsiem Emile Lemoine.
2. Symmedian point (symédiane, from symétrique de la médiane), proposed by Monsieur Maurice d'Ocagne. The Engish form "symmedian" was suggested by Mr. R. Tucker in 1884.
3. Minimum point, suggested by Dr. E. W. Grebe.
4. Grebe's point, proposed by Dr. A. Emmerich.
5. Lemoine's point, proposed by Professor J. Neuberg.

## MEIHODS OF CONSTRUCTING THE POINT.

1. Draw the medians $A M_{a}, B M_{b}$ of the triangle $A B C$. Theu draw $A K^{\prime}{ }_{a}$, $\mathrm{BK}^{\prime}{ }_{\mathrm{b}}$, making the same angle with the bisectors of angles A and B , respectively, as are made by $\mathrm{AM}_{\mathrm{a}}$ and $\mathrm{BM}_{\mathrm{b}}$. The intersection of $\mathrm{AK}^{\prime}{ }_{\mathrm{a}}, \mathrm{BK}_{\mathrm{b}}^{\prime}$ is K , the symmedian point.
2. Draw antiparallels to BC and CA . Join A and B , respectively, to the midpoints of these antiparallels, and the intersection of these joining lines is K , the symmedian point.
3. To the circumcircle of the triangle draw tangents at $B, C$ and $A$, and let these intersect in X, Y, Z, respectively. Then AX, BY, CZ concur at K, the symmedian point.

## SOME PROPERTIES OF THE POINT.

1. K is the point isogonal conjugate to G , the centroid.
2. If $\mathrm{K}_{\mathrm{a}}, \mathrm{K}_{\mathrm{b}}, \mathrm{K}_{\mathrm{c}}$ are the feet of the perpendiculars from K to the three sides respectively, then

$$
\left.\begin{array}{l}
\mathrm{KK}_{\mathrm{a}}=\frac{2 \triangle \mathrm{a}}{\mathrm{a}^{2}+\mathrm{b}^{2}+\mathrm{c}^{2}} \\
\mathrm{KK}_{\mathrm{b}}=\frac{2 \triangle \mathrm{~b}}{\mathrm{a}^{2}+\mathrm{b}^{2}+\mathrm{c}^{2} .} \\
\mathrm{KK}_{\mathrm{c}}=\frac{2 \triangle \mathrm{c}}{\mathrm{a}^{2}+\mathrm{b}^{2}+\mathrm{c}^{2} .}
\end{array}\right\} \begin{aligned}
& \text { Where } \triangle \text { is the area of the triangle } \\
& \mathrm{ABC}, \text { and } \mathrm{a}, \mathrm{~b}, \mathrm{c} \text { are three sides of } \\
& \text { the same triangle. }
\end{aligned}
$$

3. Area of $\triangle \mathrm{BKC}=\frac{\mathrm{a}^{2}}{\mathrm{a}^{2}+\mathrm{b}^{2}+\mathrm{c}^{2}}$

Area of $\triangle \mathrm{CKA}=\frac{\triangle \mathrm{b}^{2}}{\mathrm{a}^{2}+\mathrm{b}^{2}+\mathrm{c}^{2}}$
Area of $\triangle A K B=\frac{\triangle c^{2}}{a^{2}+b^{2}+c^{2}}$
$\triangle \mathrm{BKC}: \triangle \mathrm{CKA}: \triangle \mathrm{AKB}=\mathrm{a}^{2}: \mathrm{b}^{2}: \mathrm{c}^{2}$.
4. Antiparallels to sides of the triangle through K are equal. Such antiparallels cut the sides of the triangle in six points which lie on a circle whose centre is K . This circle is called the Cosine Circle.
5. K is the median point of the triangle $\mathrm{K}_{\mathrm{a}} \mathrm{K}_{\mathrm{b}} \mathrm{K}_{\mathrm{c}}$.
6. The line $\mathrm{KM}_{\mathrm{a}}$ ( $\mathrm{M}_{\mathrm{a}}$ is the mid point of BC ) passes through the mid point of the altitude $\mathrm{AH}_{\mathrm{a}}$.
7. The sides of the K -pedal triangle $\mathrm{K}_{\mathrm{a}} \mathrm{K}_{\mathrm{b}} \mathrm{K}_{\mathrm{c}}$ are perpendicular to the medians of ABC, respectively.
8. The sides of the G -pedal triangle $\mathrm{G}_{\mathrm{a}} \mathrm{Cib}_{\mathrm{b}} \mathrm{G}_{\mathrm{c}}$ are perpendicular to the symmedians AK, BK, CK, respectively.
9. a. GA. $\mathrm{KA}+\mathrm{b} \cdot \mathrm{GB} \cdot \mathrm{KB}+\mathrm{C} \cdot \mathrm{GC} \cdot \mathrm{KC}=\mathrm{a} \cdot \mathrm{b} \cdot \mathrm{c}$.
10. If the symmedian lines $A K, B K, C K$ meet the circumcircle of $A B C$ in $\mathrm{A}^{\prime}, \mathrm{B}^{\prime}, \mathrm{C}^{\prime}$, then the triangles ABC and $\mathrm{A}^{\prime} \mathrm{B}^{\prime} \mathrm{C}^{\prime}$ are co-symmedian, that is they have the same symmedian point K .
11. K and $M$ ( $M$ is the circumcentre of $A B C$ ) are opposite ends of a diam. eter of Brocard's Circle.
12. Parallels to the sides of ABC through K , determine six points on the sides which lie on the Lemoine Circle.
13. If points $\mathrm{A}^{\prime}, \mathrm{B}^{\prime}, \mathrm{C}^{\prime}$ be taken on $\mathrm{KA}, \mathrm{KB}, \mathrm{KC}$ so that $\mathrm{KA}^{\prime}: \mathrm{KB}^{\prime}: \mathrm{KC}^{\prime}=$ $\mathrm{KA}: \mathrm{KB}: \mathrm{KC}=$ constant, then antiparallels to the sides through $\mathrm{A}^{\prime}, \mathrm{B}^{\prime}, \mathrm{C}^{\prime}$, respectively, determine six points on the sides of the triangle which lie on a Tucker Circle.
14. If $\mathrm{A}_{1} \mathrm{~B}_{1} \mathrm{C}_{1}$ is Brocard's first triangle, then
$\mathrm{A}_{1} \mathrm{~K}$ is parallel to BC .
$\mathrm{B}_{1} \mathrm{~K}$ is parallel to CA.
$\mathrm{C}_{1} \mathrm{~K}$ is parallel to AB .
15. AK, BK, CK produced meet Brocard's circle again in $\mathrm{A}^{\prime \prime}, \mathrm{B}^{\prime \prime}, \mathrm{C}^{\prime \prime}$ respectively, and these points form Brocard's second triangle $\mathrm{A}^{\prime \prime} \mathrm{B}^{\prime \prime} \mathrm{C}^{\prime \prime}$.
16. If $\mathrm{KA}, \mathrm{KB}, \mathrm{KC}$, meet the sides of ABC in $\mathrm{X}_{1}, \mathrm{X}_{2}, \mathrm{Y}_{1}, \mathrm{Y}_{2}$ and $Z_{1}, Z_{2}$ respectively, then the sides of the triangle $Z_{1} X_{1} Y_{1}$ are parallel to $A \Omega, B \Omega, C \Omega$ respectively, and the sides of $\mathrm{Y}_{2} Z_{2} \mathrm{I}_{2}$ are parallel to $\mathrm{A} \Omega^{\prime}, \mathrm{B} \Omega^{\prime}$, $\mathrm{C} s^{\prime}$ respectively, where $\Omega$ and $\Omega^{\prime}$ are the Brocard points of $\mathrm{ABC} . \Omega$ and K are the Brocard points of $Z_{1} X_{1} Y_{1}$ and $\Omega^{\prime}$ and $K$ are the Brocard points of $Y_{2} Z_{2} X_{2}$.
17. The point of concurrency $D$ of $A_{1}, \mathrm{BB}_{1}, \mathrm{CC}_{1}$ is the point isotomic conjugate to K .
18. The line MK is perpendicular to and bisects the line $\Omega \Omega^{\prime}$.
19. The Simson line of Tarry's point is perpendicular to MK.
20. $\operatorname{Cot}<\mathrm{KBC}+\cot <\mathrm{KCA}+\cot <\mathrm{KAB}=3 \cot \omega$ where $\omega$ is the Bocard angle.
21. If the symmedian AK cut BC in $\mathrm{K}^{\prime}$ a and the line $\mathrm{MM}_{\mathrm{a}}$ in $Q$ then $\left(\mathrm{AK}^{\prime}{ }_{\mathrm{a}}, \mathrm{KQ}\right)$ is a harmonic range.
22. If from $K_{n}^{\prime}$ perpendiculars $p$ an $q$ are drawn to $C A, A B$ respectively, then

$$
\frac{p}{b}=\frac{q}{c}=\frac{2}{a^{2}+b^{2}}
$$

23. $\mathrm{AK}: \mathrm{KK}^{\prime}{ }_{\mathrm{a}}=\mathrm{b}^{2}+\mathrm{c}^{2}: \mathrm{a}^{2}$
24. $\mathrm{BK}^{\prime}{ }_{\mathrm{a}}: \mathrm{K}_{\mathrm{a}}^{\prime} \mathrm{C}=\mathrm{c}^{2}: \mathrm{b}^{2}$

$$
\mathrm{CK}^{\prime}{ }_{\mathrm{b}}: \mathrm{K}_{\mathrm{b}}^{\prime} \mathrm{A}=\mathbf{a}^{2}: \mathrm{c}^{2}
$$

$$
A K_{c}^{\prime}: K_{c}^{\prime} B=b^{2}: a^{2}
$$

$$
\mathrm{BK}_{\mathrm{a}}^{\prime}=\frac{\mathrm{ac}^{2}}{b^{2}+\mathrm{c}^{2}} \text { etc }
$$

25. The tangent to the circumcircle at $A$, and the symmedian $A K$ are harmonic conjugates with respect to $A B$ and $A C$.
26. The angles $A M K, B M K, C M K$ are equal respectively to the angles $\left(B C, B_{1} C_{1}\right)\left(A C, A_{1} C_{1}\right),\left(A B, A_{1} B_{1}\right)$, that is the respective angles between the sides of Brocard's first triangle and the corresponding sides of the fundamental triangle.
27. The sides of the $\quad \mathrm{K}_{\mathrm{a}} \mathrm{K}_{\mathrm{b}} \mathrm{K}_{\mathrm{c}}$ are proportional to the medians of the $\triangle A B C$, and the angles of the $\quad K_{a} K_{b} K_{c}$ are equal to the angles which the medians make with each other.
28. The sum of the squares of the sides of $\mathrm{K}_{\mathrm{a}} \mathrm{K}_{\mathrm{b}} \mathrm{K}_{\mathrm{c}}$ is less than the sum of the squares of the sides of any other triangle inscribed in ABC.
29. The ratio of the area of $A B C$ to that of 1 ts co-symmedian triangle $\mathrm{A}^{\prime} \mathrm{B}^{\prime} \mathrm{C}^{\prime}($ See $\mathbb{N} \mathrm{O} .10)$ is $\left(-\mathrm{a}^{2}+2 \mathrm{~b}^{2}+2 \mathrm{c}^{2}\right)\left(2 \mathrm{a}^{2}-\mathrm{b}^{2}+2 \mathrm{c}^{2}\right)\left(2 \mathrm{a}^{2}+2 \mathrm{~b}^{2}-\mathrm{c}^{2}\right): 27 \mathrm{a}^{2} \mathrm{~b}^{2} \mathrm{c}^{2}$.

## Note On MeGinnis's Uxiversal Sulution.

By Robert J. Aley.

The full title of the book is, "The Universal Solution for numerical and literal equations by which the roots of equations of all degrees can be expressed in terms of their coefficients, by M. A. McGinnis, Kansas City, Missouri, the Mathematical Book Company, 1900."

In his preface the author announces that the book appears at "the request of many able mathematicians, teachers and scholars throughout the United States." He also modestly states that the imaginary is for the first time put upon a true basis, that bi-quadratics are more thoroughly
