

AN ARRANGEMENT OF THE ASCOMYCETES OF INDIANA.<sup>1</sup>

BRUCE FINK AND SYLVIA C. FUSON.

In this second contribution toward a knowledge of the ascomycetes of Indiana, the authors present a classification of all the ascomycetes previously published for the state. The classification follows that used in the first paper, "Ascomycetes new to the flora of Indiana". So far as possible, the names of the counties from which the species have been collected are given. The list comprises 372 species from thirty-eight counties. Future studies will, of course, add largely to this number of species for the state.

While the main purpose of this paper is to bring together the names of all ascomycetes known in Indiana under a system of classification, other features are introduced as aids to mycologists who may refer to the paper. For this purpose, the distribution has been given so far as we have been able to ascertain it. Of the 372 species of ascomycetes known to occur in Indiana, 136 were recorded for the first time in our paper cited in the bibliography at the close of the present paper. The other 236 species were previously recorded for Indiana by other workers. We have determined from our collection of 630 specimens, 263 species of ascomycetes collected by us in Indiana. These are starred in the present paper. The other 109 species not starred are admitted on the determinations of others. We regret that we have not all the data at hand for giving the names of those who have determined these, but mycologists who are interested will get some clue from the bibliography. Among works of special reliability, we may mention those of Professor J. M. Van Hook and his students.

The herbarium material at the University of Indiana, at Purdue University, and at Wabash College we examined hastily; but it was not possible, in the short time available, to examine critically and verify or correct the determinations found in these collections. While a critical examination of the species found in the three herbaria would have added to the value of the present paper, it is hoped that the classification, the additions to the flora, the record of distribution, and some other features of our work may prove helpful in the further study and the final systematic account of the ascomycetes of Indiana.
