SOME UNRECOGNIZED FORMS OF NATIVE TREES.

BY STANLEY COULTER.

In the case of certain of our familiar forests there is a popular or commercial recognition of certain well-marked forms which have either escaped the attention of botanists or have been considered of such slight importance as to receive no mention in descriptive works. Some of these forms are so distinct and so persistent as to raise the question as to whether they may not be entitled to varietal rank. Certainly in a study of our forest flora they must be taken into account. I desire in this paper to call attention to some of these botanically unrecognized forms, hoping by this means to receive added information upon this point.

ASIMINA TRILOBA D'NAL.

The papaw has two easily distinguishable forms, which may be characterized as—
